Containers

We design and manufacture containerized solutions adapted to all sorts of purposes for either civil, commercial or military purposes.

TECNOVE

TECNOVE  
Fiberglass

Our containers can be developed to operate with multimodal transportation, as such they can be transported by land, sear or air. Once these containers are deployed, they shall fulfil the specific purpose they are designed and equipped for with ease.

We bear on our back a bag of decades working in design, manufacturing and transformation of containers that are developed in accordance to the client's needs.

Among the many containerized solutions that we have developed, the most demanded ones have been the ones designed for communication, mechanical operations, to serve as workshops, to act as defensive elements and other special civil and military uses.

Our containers are manufactured in accordance to international standards of sea, air and land transport, and they can be adapted to any sort of location and purpose.

We manufacture expandable containers, modular containers and anything you would imagine.

1 · Expandable

2 · Refrigerated

3 · Standardized

4 · Modular

5 · Customized

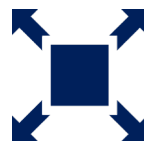

6 · Generator Enclosures

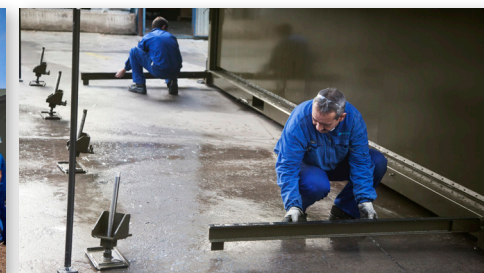

# Expandable Containers

These containers are designed with foldable structures which can expand the width or the height of a container thanks to its dual integration system. These are especially useful for providing greater operational or storage areas while they are deployed and, at the same time, they are extremely efficient in terms of transportation as they have a compact format when they are not deployed.

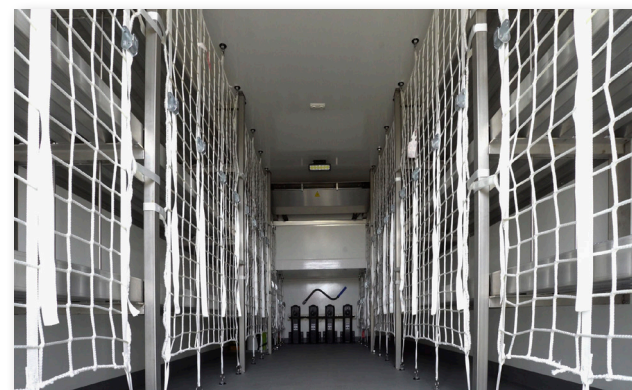

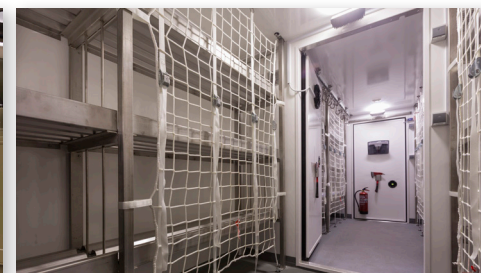

# Refrigerated Containers

These are design taking in to account the specific needs of a particular product. Be it food or military items, these containers will guarantee the efficient storage and transportation thanks to controlled temperature systems. They can be manufactured in different sizes and formats, and the design can be adapted to the client's requirements.

# Standardized Containers

Our general-use or standard containers can be utilized any type of industry and they can be presented in several ISO-complaint variations, including the most common ones (20 and 40-feet containers). These can be adapted, transformed and equipped for any purpose.

# Modular Containers

These containers are designed to bear within a series of modules which can be rearranged depending on the needs a client may have at a specific time. These containers can also be combined with one another to have more storage space or to have higher heights and wider widths to store different-sized products. These are easy to transport and are more efficient than fixed storage facilities thanks to their modular capacities.

# Customized Containers

These containers are the pinnacle of mobility. For their outer and inner parts can be modified and adapted to fit any expectation and to become suitable for very specific or special purposes, and, at the same time, keep their mobility efficiency in terms of transportation and deployability.

# Generator Enclosures

Our Generator Enclosures are developed as soundproof containers to bear within huge generators in order to supply with power any facility or machinery as quietly as possible.
