Soluciones Eléctricas

We aim to achieve a conscious and responsible use of the power in our hands. We work together to seek and find innovative solutions that are climate conscious and that aid in power savings.

In the electric power sector, we are usually involved in two kinds of projects:

- The design, setup and maintenance of photovoltaic arrays, solar farms or wind farms taking care of the client's paperwork and kickstarting the project.
- We provide a top-down management solution for any type of electricity-related project easing the documentation and approval process, and any other services to guarantee the upkeep of electricity facilities, power plants or generators.

## 1 · Solar and Wind Power Projects

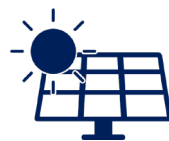

## 2 · Electricity Projects

# Solar Power Projects

As time goes by, many more companies and institutions make the switch to renewable energies in hopes of avoiding a gloomy future and reducing production costs in up to 80%.

We have capacities for designing and setting up solar and wind farms developed with the purpose of generating as much energy as possible in the safest manner. After building these solar or wind power farms we can guarantee that their cleaning, maintenance, security and safety requirements will be met with the utmost efficiency by our team.

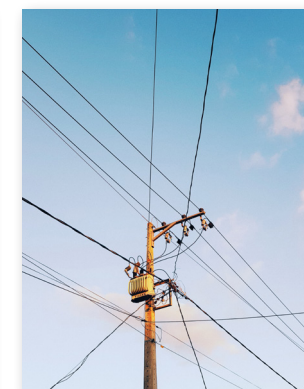

# Electricity Projects

We offer management, design and engineering services of all types of electricity facilities as well as their maintenance and up to date functionality.

We develop projects of any size and purpose including inward installations, aerial and ground wiring, electric circuitry, Transformers, fuel tanks and generators.
